

BURNT VEHICLES

WEATHERING SET

This weathering set will allow you to faithfully recreate the appearance of burnt-out vehicles. The four included pigment colours will help you to reproduce the ashes, black stains and other effects that may be observed on fire-damaged vehicles, whilst our well-received Pigment Fixer will allow you to fix your work in an effective way.

With pigments is the best way to achieve this kind of effects, because of its similarity with real soot, textures and suspended particles, we can achieve different effects depending on application method and even the color combination. References AK144 Burnt Rust Red, AK142 White Ashes, AK039 Black and AK143 Burnt Umber are ideal for achieving the effects of fire.

1 Over a layer of Burn Rust we apply Black pigment, starting from a piece on which we will have reproduced a rusty area as the basis for the next pigments.

2 Mixing pigments White, Black, Burnt Umber we apply by brush the mixture over the black to achieve different shades.

3 Finally apply AK142 White Ashes pigment but restricting its use to certain areas.

4 With Pigment Fixer we seal certain areas. When using it we must consider that the end result will darken slightly.

5 Appearance of the piece with the effect of fire and rust produced.

6 We apply again AK038 Black and AK142 White Ashes pigment but this time we fix them only with the brush.
